

Benefits of Water Softeners

Water softeners provide us with many benefits, and are particularly suitable in areas with hard water. Water softeners remove minerals, making cleaning easier and water healthier.

Drinking Water

Although hard water is usually treated in our towns and cities, making it safe to drink, soft water is generally purer.

Cleaning

There is less scale build up to contend with. Cleaning toilets, sinks, bathtubs etc. is easier as there is little scaly build up.

Appliances

Operating a water softener to provide soft water will lengthen the life of your appliances. Hard water damages appliances by leaving behind a scaly buildup of minerals on the inside and on working parts, thus decreasing their useful lifespan and also making them work less efficiently.

Healthier skin

Hard water dries out your skin and hair, causing irritations, blocking pores and exacerbating problems like eczema. Soft water brightens your hair, leaving it shinier.

Plumbing

Having soft water in your plumbing as the result of installing a water softener reduces the scale build up in your plumbing, saving you money in the long run.

Heating Water

Soft water does not leave scale behind in your water heater. This means that the heating element is directly in contact with the water, heating it more quickly.

Hard water is water that contains an appreciable amount of dissolved salts of calcium and magnesium. Water softeners can remove calcium and magnesium, thus softening water.

Soft water has a distinct advantage when it comes to the overall water use in your home - particularly in relation to household chores. Soft water lathers more easily, and with smaller quantities. This makes washing dishes, doing laundry, taking showers and other chores easier.
